Flexible: AutoDesk 3D-Invertor connection

For the Swiss company Swibox an Autodesk 3D-Invetor connection has been realised according to their individual needs

The medium-sized company Swibox AG, located in Balterswil Switzerland, has got among other things the general agency for ELDON in Switzerland.

Swibox produces individual costume-made cabinet system solutions made of different material. The quick delivery of adapted standard cabinets from the ELDON delivery program and customised solutions are the important technical skills from Swibox.

As back office, Swibox uses the 3D-construction software Autodesk Inventor. Inventor does not only provide a construction and manufacturing base, but also being used for the planning at the customer due to its elegant visualisation. The ELDON cabinets are lodged as 3D drawings in Inventor, required adaptations are immediately being drawn and agreed at the customer.

As soon as the customer gives his approval, the production has to be carried immediately from the inventor data, only that way mistakes can be avoided when requisitioning production steps. The quality is there.

From this requirement the software specialist from STEINHAUER allowed the adaptation from Autodesk Inventor to the eCAB series working machines.

The from STEINHAUER supplied concept and the software solution provide a smooth workflow from the back office to the production.

The shareholder from Swibox AG, Mr. Huwiler, is extremely satisfied with this solution: In association with the STEINHAUER eCAB ModCenter has been realised a solution that unifies great flexibility and maximum quality.

The offer of a fitting solution from STEINHAUER for the special requirements was compared to others, the decisive customer advantage for Swibox.
